to the point that an exact computation of the derivative requires a lot of function evaluations. It might be significantly simpler to approximate the derivative instead of computing its exact value. â€œ When approximating solutions to ordinary (or partial) differential equations, we

function. ... Here is the general computation. Suppose n is a negative integer; the algebra is easier to follow if we use $n = -m$ in the computation, where m is a positive integer. $\frac{d}{dx} x^n = \frac{d}{dx} x^{-m}$
